

## MVP Brief

ChuneApp is creating a social media app that is going to connect the world through music.

Users will be able to login into the platform with their music provider and post music to the platform.

All of the music posted on Chune must be able to be streamed within the app.

Using the design elements sent to you please create a TestFlight micro APP.

That micro APP you create must:

- Implement the loading screen (please use designs as a reference)
- Allow users to log in via **Spotify** or **Apple Music** using the relevant **API's**
- Allow the user to create a username and upload a profile image
- Allow the user to post music to their profile (Also shared to the Home Page)
- Include a number of user accounts that you must create to mimic a live app
- Implement these user accounts into the top followers option so the user can decide who they follow
- Allow users to **stream** all of the music posted to the platform
- Implement sticky music player at the bottom of each page

## Submission

Please provide a downloadable link to the app you have created to [chuneapp@gmail.com](mailto:chuneapp@gmail.com)
